

Trace Tool

Socket mode webmodule (.NET 1.1)

In *TraceTool 7.0* you have three different mode to set up the tracer into socket mode in *ASP.NET*.

- Hard coded, like `TTrace.Options.SendMode = SendMode.Socket;`
- By using *Web.TraceTool* file
- Using a webmodule. This document is an outline for it.

You'll find an *Visual Studio 2003* solution and also compiled library in this archive.

Add a reference from you web application (or simply copy the `.dll` into the `/bin` directory), and paste this section into the *Web.Config*:

```
<httpModules>
  <add type="TraceToolSocketMode.TTSocketMode,TraceToolSocketMode"
        name="TTSocketMode" />
</httpModules>
```

After this, the web application will use *TraceTool* in socket mode.
